

List of examples

Example 1.1	A sine wave computed in MATLAB. Code examples in this book will be in this format.	3
Example 2.1	An Apollo Lunar Module-type phase-plane controller. The red and blue lines are the optimal switching lines. They are separated in the first plot because of the fuel consideration of the optimal control. The second plot shows the time optimal switching curves.	14
Example 2.2	Walker and polar-star constellations.	22
Example 3.1	Single-axis step response.	27
Example 3.2	Single-axis step response when there is a second mode. The eigenvalues are given. It has one oscillatory mode and one rigid-body mode.	29
Example 5.1	Quaternion rotation of a unit vector.	57
Example 5.2	Quaternion maneuver. The spacecraft model is three double integrators.	60
Example 5.3	Quaternion interpolation.	63
Example 6.1	Inertia matrix for a satellite represented by three boxes.	69
Example 6.2	Rigid-body dynamics showing momentum conservation. Note the Y-axis scale. The top simulation has a time step of 1 second, the bottom has a time step of 0.2 seconds.	70
Example 6.3	Momentum-bias spacecraft nutation.	72
Example 6.4	Two formulations for gravity gradient. The second can accommodate off-diagonal terms.	79
Example 6.5	Major- and minor-axis spin.	81
Example 6.6	Angular-momentum conservation for a three-body model with a single degree-of-freedom hinges at the attachment points. The growth of momentum changes with the size of the time step.	90
Example 6.7	Comparison of the gyrostat and hub models.	91
Example 6.8	Reaction-wheel pulse response for a spacecraft with two bodies and three reaction wheels.	98
Example 7.1	Atmosphere-density models.	106
Example 7.2	Comparison of NRLMSISE with scale heights.	106
Example 7.3	Difference between a dipole and Meade–Fairfield magnetic-field model.	113
Example 8.1	Drag for different atmosphere models.	124
Example 8.2	Knudsen number. The shaded region is the free-molecular regime.	125
Example 8.3	Surface-accommodation coefficients.	127
Example 8.4	Free-molecular flow drag and lift coefficients. The bottom plot includes the Maxwellian atmospheric velocity.	128
Example 8.5	Electrodynamic force in an ISS orbit.	129
Example 8.6	Difference between a dipole and Meade–Fairfield magnetic-field model.	132
Example 8.7	Torque due to a residual dipole in geosynchronous orbit.	132

Example 8.8	Comparison between pure specular and pure absorption.	134
Example 8.9	Outgassing from the Microwave Anisotropy Spacecraft. Both exponential and square-root models are shown.	140
Example 8.10	Fourier coefficients of a harmonic function.	144
Example 8.11	Fourier coefficients for a spacecraft in geosynchronous orbit.	144
Example 10.1	Reaction-wheel frequency response.	158
Example 10.2	Bristle friction and Coulomb friction.	161
Example 10.3	Double-gimbal CMG.	165
Example 10.4	Blowdown curve.	169
Example 10.5	Magnetic field at the geosynchronous-orbit altitude.	169
Example 10.6	Magnetic torque at geo.	170
Example 10.7	Magnetic-torquer mass and radius vs. voltage.	172
Example 10.8	Stepping motor.	180
Example 11.1	Earth-sensor chord.	184
Example 11.2	Scanning Earth sensor with standard chord.	186
Example 11.3	Noise sources.	193
Example 11.4	STIM300.	194
Example 11.5	Effect of the magnetic-torque rods on the measured magnetic field.	196
Example 11.6	Pinhole-camera star image.	198
Example 12.1	Bode and time-response plots.	209
Example 12.2	Single-axis quaternion maneuver. The red lines are the target quaternion. The spacecraft reaches the target but does not stop at the target.	212
Example 12.3	Gravity gradient.	214
Example 12.4	Nutation dynamics.	215
Example 12.5	Nutation dynamics with a rate damper.	215
Example 12.6	Step response.	216
Example 12.7	Control resolution example showing multiple ways of handling finite pulsewidth.	220
Example 12.8	BDot simulation.	223
Example 12.9	Low-bandwidth control simulation.	227
Example 12.10	Torque generation for magnetic torquers.	229
Example 12.11	Lyapunov-maneuver control.	232
Example 12.12	Attitude maneuvers for an orbit transfer.	233
Example 12.13	Docking simulation.	237
Example 12.14	Reaction-wheel pyramid.	241
Example 12.15	Linear programming solution for north-face thruster torque distribution.	242
Example 12.16	Torque comparison for a 90-degree rotational maneuver.	249
Example 12.17	The optimal magnetic dipole to cancel a constant disturbance torque.	251
Example 13.1	Momentum control. The right-hand side for the momentum dynamical equations is a function at the bottom of the listing.	255
Example 13.2	The Earth's magnetic field in equatorial, ISS, and polar orbits. The equatorial and polar orbits are at radii of 7000 km.	258

Example 13.3	Proportional-control momentum unloading. Shows ideal proportional control and control with magnetic torquers.	260
Example 13.4	Individual torquer-momentum unloading. Shows ideal proportional control and control with two magnetic torquers.	261
Example 13.5	Average control.	263
Example 13.6	Torque-equilibrium attitude solution.	267
Example 13.7	Solar-pressure momentum control.	269
Example 13.8	Gravity-gradient momentum unloading.	270
Example 14.1	Static Earth-sensor outputs and a pitch-angle fit to outputs 1 and 3.	274
Example 14.2	Newton–Raphson method for Sun-angle computation.	277
Example 14.3	GPS attitude solution.	279
Example 14.4	First-order filter response for two different filter time constants.	282
Example 15.1	Kalman filter.	297
Example 15.2	Kalman filter with angle measurements and a gyro.	301
Example 15.3	Kalman-filter performance. The quaternion is tracked accurately and the bias is estimated.	303
Example 16.1	Euler integration with two different time steps.	309
Example 16.2	Two disks with a PID controller.	310
Example 16.3	Control response with different delays. With a 5-second delay, the system is unstable.	316
Example 16.4	Phase-plane controller. The first plot shows the phase-plane trajectory in green without delay. The switching lines are also shown. The second shows it with the delay.	317
Example 16.5	Die roll. The probability that a dice roll will be a given number is 1/6. It takes many trials to converge to that value.	318
Example 16.6	Failed thruster. When the torque demand is the same as the failure sign, no control torque is produced.	319
Example 16.7	Artificial damping. The spacecraft appears to have damping with a time step of one second. The second simulation has the proper nutation response.	321
Example 19.1	ISS orbit in the Earth-fixed frame.	345
Example 19.2	Libration frequencies.	348
Example 19.3	Energy dissipation. The first two plots show the behavior without a dipole.	350
Example 20.1	Nutation of a minor- and major-axis spinner with and without damping.	354
Example 20.2	Spin-precession maneuver.	360
Example 21.1	Disturbances on a communications satellite during summer solstice. The Sun is 23.5 degrees out of the orbit plane.	371
Example 21.2	Roll response for a station-keeping control system.	379
Example 21.3	Pitch-loop response.	383
Example 21.4	Low-frequency roll/yaw control.	386
Example 21.5	Nutation damping.	387
Example 22.1	Attitude control system simulation.	404

Example 22.2	Momentum unloading with two torquers in a 22 000-km orbit.	406
Example 23.1	Lunar descent.	419
Example 23.2	Attitude-hold controller performance. It moves the vehicle 10 meters in x and y while maintaining altitude, given a small initial altitude error.	422
Example 23.3	Lunar-descent control simulation.	423
Example 24.1	Disturbance torque as a function of Sun angle.	433
Example 24.2	Single-axis Kalman filter. The first two plots are for the HRG. The second two for a good-quality MEMS IMU.	437
Example 24.3	JWST simulation. The PID controller damps rates using the six reaction wheels.	438
Example 25.1	Attitude control simulation.	447
Example 26.1	Control-loop design code. This sets up the parameters that are used in the simulation.	454
Example 26.2	Spin up and acquisition simulation. The spacecraft acquires the target quickly.	455
Example 27.1	Control with moving masses.	466
Example 27.2	Vanes for torque balancing.	468
Example 27.3	Attitude control simulation with vanes for momentum control. Momentum control is not enabled.	470
Example A.1	Numerical integration.	481
Example A.2	Coulomb friction.	482
Example A.3	Smooth friction.	483
Example B.1	Dog-birth problem.	489
Example B.2	Hypothesis testing.	490
Example B.3	Gaussian pdf and cpdf.	492
Example B.4	Monte Carlo simulation with a Gaussian random input and a uniform random-number damping ratio.	496
Example E.1	11/'Oumuamua and a nuclear-fusion-powered spacecraft playing catch-up with the interstellar object.	510
Example E.2	Four asteroids showing their heliocentric orbits. The orbit propagation is Keplerian.	510
Example E.3	ISS orbit about the Earth in the ECI and Earth-fixed frames.	512
Example E.4	4179 TOUTATIS attitude motion. The motion is irregular. The inertia matrix is scaled by I_{zz} .	513
Example E.5	The Hipparcos star catalog. The bottom plot shows the number of stars as a function of visual magnitude. Visual magnitude is the brightness perceived by the human eye. Beyond ten the number of stars increases slowly.	513
Example G.1	Bode plot.	521
Example G.2	Nichols plot.	522
Example G.3	Root-locus plot.	522
Example G.4	Double-integrator plant.	526
Example G.5	Double-integrator model.	539

Example G.6	Torque transmission.	540
Example G.7	Loop-compensation example.	543
Example G.8	Delay example.	548
Example G.9	Bode magnitude plot of the rate-control loop with delays of 0.5 and 1 second.	548
Example G.10	Comparison of pulsewidth modulator and zero-order hold.	551
Example G.11	Comparison of the four rate estimators.	554
Example G.12	Comparison of the matched pole zero with the estimator.	556
Example G.13	Control of a double integrator with a lead network.	559
Example G.14	Bode plot for the collocated sensor and actuator transfer function.	560
Example G.15	Bode plot for the noncollocated sensor and actuator transfer function.	561
Example G.16	Lead compensator with flex node added.	562
Example G.17	Lead compensator providing flex damping.	563
Example G.18	Bode plot for the noncollocated sensor and actuator transfer function.	564
Example G.19	Bode plot for the noncollocated sensor and actuator transfer function with a phase-lead controller and a crossover at 0.05 rad/s.	564
Example G.20	Root-locus plot for the noncollocated sensor and actuator transfer function with a phase-lead controller.	565
Example G.21	Bode plot with a high-frequency phase-lead controller.	565
Example G.22	Bode plot with a flex compensator zero at 0.6 rad/s.	566
Example G.23	Model-following control.	568
Example G.24	Model-following control response with increasing gain.	569
Example G.25	Second-order response.	571
Example G.26	Effect of the integrator on a second-order step response.	573
Example G.27	Phase-plane controller.	574
Example G.28	PID damping ratio.	575
Example G.29	Windup compensation.	576
Example H.1	Single-integrator Kalman-filter results.	586
Example H.2	Gaussian distribution.	589
Example H.3	Nonlinear-spring simulation. It shows the nonlinear and linear spring forces.	597
Example H.4	Nonlinear-spring simulation generating noisy measurements.	598
Example H.5	Conventional (or linear) Kalman filter for a nonlinear spring.	599
Example H.6	Extended Kalman filter for a nonlinear spring.	600
Example H.7	Unscented Kalman filter for a nonlinear spring.	601
Example I.1	Orbit simulation of impulsive inclination change.	611
Example I.2	Linearized orbit-frequency response.	616
Example J.1	Diffraction-limited resolution.	623
Example J.2	Airy pattern for a point source.	624
Example J.3	Light-gathering capability of a telescope.	625
Example J.4	Visible stars for an ideal aperture.	626
Example J.5	Circle of confusion.	627

Example J.6	Pinhole-camera star image.	628
Example J.7	Earth, Moon, and Sun spectra.	629
Example L.1	Magnetic-hysteresis damping. The energy drops towards zero.	654
Example M.1	XOR neural-network weights converge during training.	670
Example M.2	Neural network trained to produce pitch-and-roll measurements from sensor measurements.	673
Example M.3	Case-based expert system for reaction-wheel fault detection.	678
Example M.4	Optimal attitude trajectory.	681
Example M.5	One-axis reinforcement learning.	684
